Clinics biopsychosocial: a scientific journal that will promote dialogue between science and society

Italla Maria Pinheiro Bezerra

The creation of scientific journals must be understood as a space that goes beyond a peers’ conversation; it is a space for constituting science, in which it becomes a privileged place permeated by a dialogue between science and society; it is a space that will bring together the knowledge produced by science and that disseminated in practice and in the social imaginary.

Santa Casa de Misericórdia de Vitória Superior School of Sciences is celebrating its 55th anniversary this year, 2023, and over the years has always believed in the importance of scientific dissemination, emphasizing that the community should not remain closed in its world of specialists; it is necessary to take a stand and participate in the public debate and, for this reason, the school already has in the curriculum of its courses the appreciation of scientific dissemination, which is consolidated through incentives for publications, organization of scientific events, among other means.

In the training of its students, the curriculum already comes from the perspective of a close relationship built between science and health, in which it believes in the advances of this relationship in which health should not be seen as the absence of disease, defending that the understanding arising from purely biomedical knowledge has not been sufficient to meet the demands in health - characteristics of postmodern societies.

Emescam’s curricula began to provide students with critical and reflective training based on this new demand that seeks not only to treat diseases, but also to guarantee higher levels of health. This is a training based on the perception of the imminent need to complete information, widely consolidated from biomedical rationality, about health conditions, including information involving experiences in relation to body functions and structures, activities, participation, environmental factors and personal factors; such perception is in line with the theoretical framework strongly based on the Biopsychosocial Model.

Thus, based on the Biopsychosocial Model aimed at the real needs of users, the identification of technologies available at each point of care in the Lines of Care, as well as the combination in a planned and agreed way between those responsible for offering these resources, a humanized and integral care for health is expected; and it is in this perspective that Emescam promotes health training for its students.

And it was with this understanding, that in the year 2023, envisioning the strengthening towards the enhancement of scientific dissemination as part of the academic activity, and with the perception of the relationship between science and teaching, having this training as a pillar with the biopsychosocial perspective, that The Superior School of Sciences of the Holy School of Mercy of Victoria launched the Journal Clinics Biopsychosocial (CBPS) of Santa Casa de Misericórdia de Vitória Superior School of Sciences, a space for scientific dissemination whose pillars are ethics, legality, morality and social responsibility; these being the values that will sustain this journal.

The Clinics Biopsychosocial (CBPS) is a quarterly journal that will publish original articles, review articles, editorials and commentaries, covering the area of Health and Applied Social Sciences, as well as different areas of knowledge. Through the production and dissemination of scientific knowledge, CBPS aims to encourage the study, improvement and updating of professionals, with an interdisciplinary focus, contributing to the dialogue between research and society, and also to maintaining the flow of scientific communication at Emescam and other National and International Higher Education and Research Institutions.

In its first edition, it brings discussions that permeate the major areas of knowledge, with important themes for public health and that bring reflections aiming to give visibility in the different contexts in which the health-disease process and its social determinants are involved, for better decision-making, whether in the scope of professional intervention or the management of public policies, as well as, to broaden the view that prevention and health promotion actions must be understood in a transversal and interdisciplinary way, so that one can reflect on the processes that involve political, socioeconomic and cultural aspects that interact directly with the health-disease process.

In this context, the Journal Clinics Biopsychosocial is an instrument for scientific dissemination that will discuss topics relevant to public health, and with the potential to become one of the main vehicles that will promote the expansion of discussions on topics as important as those presented in its first edition\textsuperscript{4-13}.
